

ACO. creating
the future of drainage

PORTFOLIO

University of Colorado Hospital Aurora, CO

During the design of the new University of Colorado Hospital Anschutz Medical Campus in Aurora the helipad for Flight for Life transport helicopters was positioned across the street from the emergency department.

Project Design Brief

To ensure the helipad remains free of standing water and snow melt a trench drain was required. A trench drain would not only effectively drain the area but allowed for simple two-way falls giving a flatter surface for the helicopter and wheeled stretchers.

Benefits

- The custom trench drain from Aquaduct offered installation benefits, heavy duty ductile iron grates were used to withstand the loadings from helicopters, ambulances and stretchers.
