we care for water

PORTFOLIO

McGhee Tyson Airport Parking Knoxville, TN

There are several off-site and on-site airport parking facilities in and around the McGhee Tyson Airport. One of the three lots known as the long-term parking lot is a ten-minute walk to the airport terminal building and is currently undergoing renovations.

Project Design Brief

During the restoration of McGhee Tyson Airport's parking lot, engineers determined that a trench drain would be required to drain storm water runoff and minimize ponding. The FlowDrain FG200 system by ACO was selected and installed in around the parking lot area.

Benefits

- The FG200 fiberglass channel with a mounted steel frame provides a quick and simple way to create a smooth, corrosion resistant trench drain.
- The FG200 system is available in twelve, interconnecting, 9-foot long channels with a built in 1.0% slope.
