

# ACO DRAIN

## Port of Pasco Terminal Apron Pasco, WA

### PROJECT PORTFOLIO

#### Product:

#### *FG200 with ductile Iron slotted grates*

The Port of Pasco Airport is a medium size airport that needed a new apron and de-icing pad to handle the increasing flights scheduled. The new areas required a surface drainage system to prevent any ponding water and to collect deicer for recycling.

The fiberglass channel also offered excellent resistance to the de-icing chemicals used at the airport. The ductile iron grates can withstand the loads and chemicals that may come in contact with the grates.

ACO Drain FG200 was chosen for its excellent hydraulics making it ideal for the wide flat concrete areas.
