

ACO. creating
the future of drainage

PORTFOLIO

Hampton Bay Firehouse Hampton Bay, NY

A fire house substation was needed as volunteers would often get delayed on Montauk Highway, where the main firehouse is located when responding to alarms in the summer months.

Project Design Brief

The design of the new fire house substation included trench runs located centrally in front of the truck parking bays to collect washed down water. The drive slopes toward the building, and at the request of the local fire chief, a run of trench drain was added to act as a threshold drain to intercept rain water.

Benefits

- S100K has been tested up to Load Class F for the wide variety of vehicles that would be using the road.
- Grates are locked into the channel at 8 points on every meter channel which reduces the risk of missing or losing grates.
