

ACO. creating
the future of drainage

PORTFOLIO

Masala Avenue Modesto, CA

Modesto is genuinely known for its agriculture: the valley here has great conditions for almonds, peaches, and tomatoes.

Project Design Brief

On Masala Avenue, water was reaching 4ft high in the street and was not allowing residents to leave their property. ACO helped the city design the new system, including the use of ACO StormBrixx® for infiltration. The engineers were highly interested in the flexible configuration of ACO StormBrixx® to fit their available footprint, high void ratio (95%) and storage volumes, easy transportation to site and structural integrity. Once the final design was completed, everything was submitted for city and state approval.

Benefits

- The ACO StormBrixx® system can be used in most applications and is reduced in maintenance.
- ACO provided low installation costs that conformed to LID regulations to recharge groundwater.
