PROJECT PORTFOLIO

Product:

System 3000

In order to protect the investment of the new sports complex and running track surface, Southwest Los Angeles Community College wanted an effective yet affordable drainage system.

The contractors needed to prevent standing water from causing damage to the track surface thus, prolonging the tracks service life.

System 3000 is a slotted polymer concrete drainage system that is available in straight and radiused sections to fit around the entire track. Catch basins are used at intervals around the track for pipe connection and a matching slotted cover allows access to the system for maintenance. The flat top surface allows easy adhesion of carpet style track materials.
