

Vestavia High School Birmingham, AL

PROJECT PORTFOLIO

Product:

System 4000

Whilst refurbishing the track and field area at Vestavia High School it was decided to add a trench drain specifically for the track, rather than relying on the sub-drainage system under the artificial turf football field.

A new track surface was also being added and an effective drainage system would help ensure longevity of this track investment.

System 4000 was used as it offers removable grates for easier access to clean out any migrated or spilled in-fill material from the turf.

System 4000 is available as neutral system with three choices of depth or as a sloping system for applications requiring maximum hydraulic performance. A choice of grates is available.
